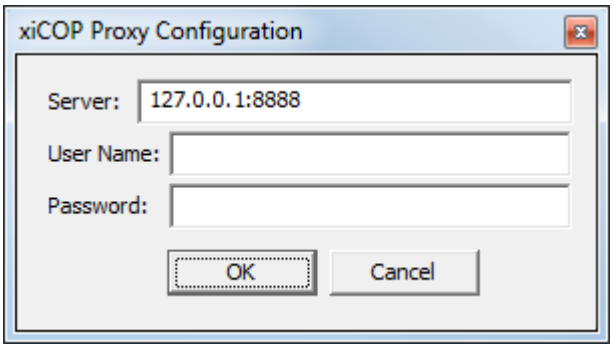
Connection to a proxy server with xiCOP¶

xiCOP allows to use a Proxy server to connect to the internet.

If proxy server is configurated in Windows Internet Options, the **xiCOP Proxy Configuration** dialog window is opened when starting the application.



Here you can edit the address of the proxy server. This field is automatically filled with the proxy settings from the Windows Internet Options dialog. If authentication is not required, after pressing the **OK** button, the main xiCOP window will start with system evaluation.
If authentication is required, insert the username and password to the designated fields and press **OK**.
xiCOP will not store the proxy server username and password, inserted credentials are valid only within the started session and must be re-entered on next start of the application.
